

# Missing APIs — Profile & Settings

APIs that don't exist on the backend today and need to be built, traced from the mobile app's actual screens.

| #  | SCREEN                        | ENDPOINT                                            | METHOD       | PAYLOAD                  |
|----|-------------------------------|-----------------------------------------------------|--------------|--------------------------|
| 1  | Edit Profile                  | /users/me/avatar/presign                            | POST         | { mime }                 |
| 2  | Edit Profile                  | /users/me/avatar/commit                             | POST         | { storageKey }           |
| 3  | Help & FAQ                    | /help/faq                                           | GET          | —                        |
| 4  | Your Area                     | /locations/search                                   | GET          | ?q=                      |
| 5  | Your Area                     | /users/me/area                                      | PATCH        | { label, lat, lng }      |
| 6  | Security                      | /users/me/sessions/:id                              | DELETE       | —                        |
| 7  | Google sign-in                | avatar_key not written on OAuth login               | fix          | —                        |
| 8  | Account → Password            | password_changed_at missing on user model           | fix          | —                        |
| 9  | Sign Up / Reset Password      | Password strength check accepts a space as "symbol" | fix          | —                        |
| 10 | Sign Up (Account step)        | /auth/register — no first/last name fields          | fix + extend | { firstName, lastName? } |
| 11 | Edit Profile (Anonymous mode) | Dummy-face avatar picker — needs product decision   | tbd          | —                        |

## 1–2 Avatar upload

Mobile already picks a photo (camera or library) in Edit Profile and has nothing to send it to. Build as presign → upload → commit, same pattern as existing evidence file uploads.

```
POST /USERS/ME/AVATAR/PRESIGN – REQUEST
{ "mime": "image/jpeg" }
```

```
RESPONSE
{ "uploadUrl": "https://...", "storageKey": "avatars/u_128/8f2c....jpg" }
```

```
POST /USERS/ME/AVATAR/COMMIT – REQUEST
{ "storageKey": "avatars/u_128/8f2c....jpg" }
```

Response: same shape as the profile endpoint, with a real avatar URL instead of always `null`.

### 3 Help & FAQ content

---

The Help screen already has search, categories, and an accordion built — it just shows hardcoded fallback content because no backend route exists.

```
GET /HELP/FAQ — RESPONSE
{
  "categories": [{ "id": "filing", "label": "Filing a report" }],
  "items": [
    { "id": "evidence-safe", "categoryId": "filing",
      "question": "...", "answer": "...", "startHere": true }
  ]
}
```

### 4–5 "Your area" search & save

---

Today this screen only shows live GPS location — no way to search a city/ZIP or save it.

```
GET /LOCATIONS/SEARCH?Q=ATLANTA — RESPONSE
{ "results": [{ "label": "Atlanta, GA", "lat": 33.749, "lng": -84.388, "placeId": "..." }] }
```

```
PATCH /USERS/ME/AREA — REQUEST
{ "label": "Atlanta, GA", "lat": 33.749, "lng": -84.388 }
```

### 6 Revoke a single device session

---

The Security screen lists devices read-only; only "Sign out everywhere" exists today.

```
DELETE /USERS/ME/SESSIONS/:ID — RESPONSE
{ "revoked": true }
```

### 7 Google sign-in — avatar not saved

---

Google returns a profile picture URL at login. It's decoded on the mobile side, never sent to the backend, and never written to the `avatar_key` column that already exists on the user table — so a Google account's avatar never appears in the app.

**Mobile fix:** read `picture` from the Google token alongside email/name, send it in the sign-in request. **Backend fix:** extract `picture` from the verified Google claims and write it to `avatar_key` on account create (and update, so a changed photo stays in sync).

## 8 Password "last changed" date

---

Account screen shows "Last changed date unavailable" — confirmed there is no `password_changed_at` (or equivalent) column anywhere on the `AppUser` model.

**Backend fix:** add a `password_changed_at` timestamp column to `AppUser`, set it whenever a password is created or changed (registration, reset, change-password), and return it in the profile response. **Mobile fix (blocked on this):** `app/profile/account-info.tsx` displays the real date once the field exists.

## 9 Password validation accepts a space as a "symbol"

---

Confirmed reproducible: a password padded with spaces plus one capital letter and one digit passes the "at least 10 characters, one capital, one number, one symbol" rule and successfully registers, because the symbol check is `/[^A-Za-z0-9]/` — which matches a plain space.

**Already fixed on mobile** (client-side validation, `lib/auth/signup-validation.ts`, `lib/auth/reset-validation.ts`, `components/ui/Progress.tsx`) — changed to `/[^A-Za-z0-9\s]/` so whitespace no longer counts.

**Backend fix still needed:** identical flawed regex exists in `blacknexus-backend/src/validations/user_auth.validation.ts` (`.pattern(/[^A-Za-z0-9]/, "symbol")`). Since the server is the authoritative validator, the mobile-side fix alone doesn't close this — apply the same `\s`-exclusion there.

## 10 First name / last name on sign-up

---

Tester-requested: email sign-up should collect a required First Name and optional Last Name. Currently the sign-up flow only collects a single `displayName` field, and `POST /auth/register` only accepts `email / password` — no name field at all, at any step.

**Backend fix:** add `first_name` (required) and `last_name` (optional) columns to `AppUser`, accept them in `register()`, return them in the profile response. **Mobile fix (blocked on this):** add the fields to the sign-up flow (`app/(auth)/sign-up/account.tsx` or a new step). Also needs a product decision on how this interacts with the existing single `displayName` field — derived from first+last, or kept separate.

## 11 Dummy-face avatar picker for anonymous mode

---

Tester-requested: anonymous mode should offer a picker of generic/placeholder face icons instead of showing name initials. **Partially addressed already:** anonymous mode now shows a single generic person-silhouette icon everywhere it used to leak initials (mobile-only fix, shipped). A full picker with several distinct designs needs a product decision on the designs, a new `AvatarMode` value (or `avatarIconId` field) plus asset references, and new mobile picker UI once that's settled.

---

Compiled from a mobile QA pass — items 1–7 traced from existing screens with no backing route; items 8–11 found and confirmed during testing (9 already patched client-side; server-side fix still open).
